

FEMMEZE®

“An innovative device to improve Dignity and Self-management of Pelvic Organ Prolapse (Rectocele)”

Nurse Consultant for Continence Sharon Eustice
Inventor of the FEMMEZE®

Cornwall and Isles of Scilly

A significant number of women suffer with the long-term and distressing condition commonly referred to as a pelvic organ prolapse (Rectocele). The condition occurs when the rectum herniates forward through into the vagina, obstructing the bowel from emptying normally.

Women with this condition may have to use their fingers to re-position the rectocele to align the rectum for voiding, this is an unpleasant process, requiring good dexterity which poses added problems with age.

The FEMMEZE® Vagina Trainer is a single user medical device that removes the need to use fingers and assists women to safely, simply and easily realign the rectum for passing stool.

The FEMMEZE® enables older women who may have difficulty due to loss of articulation/dexterity to avoid discomfort and to maintain their independence and dignity.

The FEMMEZE® Vagina Trainer is a credible and dignified personal solution to help manage the condition in a hygienic and discrete manner.
